The Potential Impact of Climate Change on Specialty Crops by Stephanie Mercier on Thu, 11/19/2020 - 10:04 In the United States, specialty crops were originally defined more or less by default ...

The Potential Impact of Climate Change on Specialty Crops
Climate change is very likely to affect food security at the global, regional, and local level. Climate change can disrupt food availability, reduce access to food, and affect food quality. [14] For example, projected increases in temperatures, changes in precipitation patterns, changes in extreme weather events, and reductions in water availability may all result in reduced agricultural productivity.

In turn, those unpleasant conditions lead to more frequent and severe wildfires, insect outbreaks, and crop failures. Sure, today's plants have a bit more fertilizer from the extra CO2 in the air, but that additional CO2 causes many other problems, harming many plants and crops. Climate change is disrupting plant growth.

he key atmospheric variables that impact crops are solar radiation, air temperature, humidity, and pre- cipitation. The day-to-day variability of these across the landscape can be described as weather. Weather extremes at critical periods of a crop's development can have dra- matic influences on productivity and yields.

The Role of Weather|and Weather Forecasting|in Agriculture. Most people know that the weather has a significant impact on the agriculture industry. Indeed, crops need the basics of moisture, warmth, and sun to thrive. But what's less obvious is how the details of weather information can drive a grower's business decisions, helping them to plan efficiently, minimize costs and maximize yields|and profits|as a result.

Because of the sensitivity of agriculture to weather and climate conditions, these impacts can have substantial direct and indirect effects on farm production and profitability. The effects of a changing climate and climate variability are already being seen across the Midwest Region: over the past century, temperatures have risen across all seasons, growing seasons have become longer, precipitation patterns have changed, and extreme precipitation events have increased in frequency and severity.

Agriculture in a Changing Climate | USDA Climate Hubs
Students explore climate graphs and an interactive computational model to discover the role of temperature and precipitation on the growth of crops. They examine how the extremes of precipitation (drought and flood) affect plant growth and they use maps of average precipitation and temperature to predict which area will be best suited for agricultural production.
