courses is to introduce students to basic methods and algorithms and have the student gain proficiency in them, nearly every topic covered in Differential Equations with Mathematica introduces basic commands and includes typical examples of application of them. A study of differential equations relies on concepts from calculus and linear algebra so the text also includes discussions of relevant commands useful in those areas.

where $M(tx, ty) = t^n M(x, y)$ and $N(tx, ty) = t^n N(x, y)$ is called a homogeneous differential equation of degree n . A differential equation that can be written in the form $M(x, y)dx + N(x, y)dy = 0$ where $\frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}$ is called an exact differential equation.

differential equations. The Mathematica function `NDSolve`, on the other hand, is a general numerical differential equation solver. `DSolve` and `NDSolve` are equipped with a wide variety of techniques for solving single ODEs as well as systems of ODEs. To compare and contrast the syntax of these two solvers, consider the differential equation $y'(t) = y(t)$,

Differential-Algebraic Equations (DAEs), in which some members of the system are differential equations and the others are purely algebraic, having no derivatives in them. As with PDEs, it is difficult to find exact solutions to DAEs, but DSolve can solve many examples of such systems that occur in applications.
