Top Answer Upgma and molecular clocks are similar because upgma is used for the creation of phenetic trees and it was designed for use in protien electrophoresis studies ,but it is currently most ofen used to produse guide trees for more sophisticated algorithms.

[Solved] 7. Explain how UPGMA and molecular clocks are ...

7. UPGMA and Molecular clocks both assume equal mutation rates, that is, mutations develop at a constant rate. The problem here is the data produced is not ultrametric (ultrametric means data is not proportional to time). You over or underestimate the time at which the species actually diverged from each other.

Solved: Explain, With Details, The Molecular Clock Discove ...

The molecular clock is a figurative term for a technique that uses the mutation rate of biomolecules to deduce the time in prehistory when two or more life forms diverged. The biomolecular data used for such calculations are usually nucleotide sequences for DNA, RNA, or amino acid sequences for proteins. The benchmarks for determining the mutation rate are often fossil or archaeological dates. The molecular clock was first tested in 1962 on the hemoglobin protein variants of various animals, and

Molecular clock - Wikipedia
