Find a 1-parameter family of solutions of each of the differential equations 1-16 listed below. Be careful to justify all steps used in obtaining a solution and to indicate intervals for which the differential equation and the solution are valid. Also try to discover particular solutions which are not members of the family of solutions.

Tenenbaum and Pollard's "Ordinary Differential Equations," chapter 1, section 4, problem 29 asks for a differential equation whose solution is "a family of straight lines that are tangent to the circle $x^2 + y^2 = c^2$, where c is a constant." Since the solutions will be lines, I start with the formula $y = m x + b$, and since the line is determined by a single parameter (the point on the circle to which the line is tangent) I expect the differential equation to be of order one.
