The first compound steam turbine of 10 horse power (page 7) ran at 18,000 revolutions per minute, and had slightly elastic bearings to allow it to rotate about its dynamic or principal axis. The turbine teeth or blades were like a cog wheel, set at an angle and sharpened at the front edges, and the guide blades were similar.

Steam Turbine is the primary device in harvesting Power from Heat, usually magma or Aquatuners, and can do it exceptionally well provided you can keep the temperature of the Steam passing the turbine high. Steam Turbines are also an incredibly effective heat deletion device capable of removing significant amounts of heat from the environment and turning the heat into power instead; this makes ...
