DBMS Transaction Processing

Concept - javatpoint

Description. Transaction processing is designed to maintain a system's Integrity (typically a database or some modern filesystems) in a known, consistent state, by ensuring that interdependent operations on the system are either all completed successfully or all canceled successfully.. For example, consider a typical banking transaction that involves moving

Transaction Processing (豆瓣)

The transaction concept emerges with the following properties:

Consistency: the transaction must obey legal protocols. Atomicity: it either happens or it does not; either all are bound by the contract or none are. Durability: once a transaction is committed, it cannot be abrogated.
